

Abstract

The invention relates to a connectable bucket tappet (1) whereby the ring shaped section (2) thereof is produced in a relatively simple and economical manner, dispensing with a receiving element for coupling means which was previously joined thereto in a single piece. According to the invention, a separate, sleeve-shaped component (14) is arranged near to the base (6) of the ring shaped section (2). Said component is used for sectionally accommodating a slider (10) as a coupling means.

Abstract

The invention relates to a connectable bucket tappet (1) whereby the ring shaped section (2) thereof is produced in a relatively simple and economical manner, dispensing with a receiving element for coupling means which was previously joined thereto in a single piece. According to the invention, a separate, sleeve-shaped component (14) is arranged near to the base (6) of the ring shaped section (2). Said component is used for sectionally accommodating a slider (10) as a coupling means.
